Problem 1:

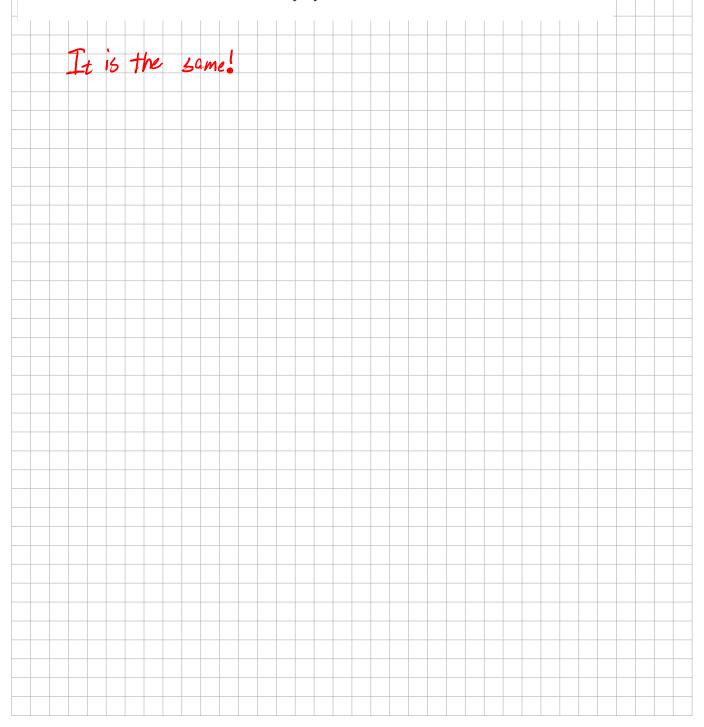

Calculate $f_{223}(x, y, z)$, $f_{232}(x, y, z)$, and $f_{322}(x, y, z)$ for the function $f(x, y, z) = e^{x-2y+3z}$.

Solution:

$$f_{223}(x,y,z) = \frac{\partial}{\partial z} \frac{\partial}{\partial y} \frac{\partial}{\partial y} e^{x-2y+3z} = 12e^{x-2y+3z}$$

$$f_{232}(x, y, z) = \frac{\partial}{\partial y} \frac{\partial}{\partial z} \frac{\partial}{\partial y} e^{x - 2y + 3z} = 12e^{x - 2y + 3z}$$

$$f_{322}(x,y,z) = \frac{\partial}{\partial y} \frac{\partial}{\partial y} \frac{\partial}{\partial z} e^{x-2y+3z} = 12e^{x-2y+3z}$$

Problem 2:

If $z = \sin(x^2y)$, where $x = st^2$ and $y = s^2 + \frac{1}{t}$, find $\frac{\partial z}{\partial s}$ and $\frac{\partial z}{\partial t}$

- (a) by direct substitution and the single-variable form of the chain rule, and
- (b) by using (two-variable) chain rule.

Solution:

(a) By direct substitution:

$$z = \sin\left((st^2)^2 \left(s^2 + \frac{1}{t}\right)\right)$$

$$\frac{\partial z}{\partial s} = (4s^3t^4 + 2st^3)\cos(s^4t^4 + s^2t^3)$$

$$\frac{\partial z}{\partial t} = (4s^4t^3 + 3s^2t^2)\cos(s^4t^4 + s^2t^3)$$

(b) Using the chain rule:

$$\frac{\partial z}{\partial s} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial s} = (4s^3t^4 + 2st^3)\cos(s^4t^4 + s^2t^3)$$

$$\frac{\partial z}{\partial t} = \frac{\partial z}{\partial x}\frac{\partial x}{\partial t} + \frac{\partial z}{\partial y}\frac{\partial y}{\partial t} = (4s^4t^3 + 3s^2t^2)\cos(s^4t^4 + s^2t^3)$$

I beleive the solution to be correct:)

Problem 3:

Find the rate of change of $f(x,y) = y^4 + 2xy^3 + x^2 + y^2$ at (0,1) measured in each of the following directions:

(a)
$$i + 2j$$
, (b) $j - 2i$, (c) $3i$, (d) $i + j$.

Solution:

We calculate.

$$\nabla f(x,y) = (2y^3 + 2xy^2)\mathbf{i} + (4y^3 + 6xy^2 + 2x^2y)\mathbf{j},$$

$$\nabla f(0,1) = 2\mathbf{i} + 4\mathbf{j}$$

(a) The unit vector in the direction of ${\bf i}+2{\bf j}$ is $\frac{{\bf i}+2{\bf j}}{\sqrt{5}}$.

$$\frac{\mathbf{i}+2\mathbf{j}}{\sqrt{5}}\cdot(2\mathbf{i}+4\mathbf{j})=2\sqrt{5}$$

(b)
$$\frac{-2\mathbf{i}+\mathbf{j}}{\sqrt{5}} \cdot (2\mathbf{i}+4\mathbf{j}) = 0$$

(c) The unit vector in the direction of 3i is just i.

$$\mathbf{i} \cdot (2i + 4j) = 2$$

(d) The unit vector in the direction of i+j is $\frac{i+j}{\sqrt{2}}.$

$$\frac{\mathbf{i}+\mathbf{j}}{\sqrt{2}}\cdot(2\mathbf{i}+4\mathbf{j})=3\sqrt{2}$$

Problem 4:

Find the Jacobian matrix $D\mathbf{f}(1,0)$ for the transformation from \mathbb{R}^2 to \mathbb{R}^3 given by

$$\mathbf{f}(x,y) = (\underbrace{xe^y + \cos(\pi y)}_{f_1}, \underbrace{x^2}_{f_2}, \underbrace{x-e^y}_{f_2})$$

And use it to find an approximate value for f(1.02, 0.01).

Solution:

$$d\mathbf{f} = D\mathbf{f}(1,0)d\mathbf{x} = \begin{pmatrix} 0.03 \\ 0.04 \\ 0.01 \end{pmatrix}$$

Therefore, $\mathbf{f}(1.02, 0.01) \approx (2.03, 2.04, 0.01)$. $\begin{array}{c|c}
\frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} \\
\frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} \\
\frac{\partial f_3}{\partial x_1} & \frac{\partial f_3}{\partial x_2}
\end{array}$ $\begin{array}{c|c}
e^{y} & xe^{y} - \sin(\pi y)\pi \\
2x & 0 \\
0 & - e^{y}
\end{array}$ 1.00 - Sin(=)-F] (1,0) $\left(\int_{(1,0)}^{1}\right) \times \begin{bmatrix} 1,02\\0,01\end{bmatrix} =$ 2.04
