## Opgave 4

Betragt differentialligningen

$$y''(t) + 4y(t) = \exp(-2t) = e^{-2t}$$

hvor y(0) = 0 og y'(0) = 0.

Brug nu Laplacetransformation til at løse ligningen og således bestemme y(t).

$$\Rightarrow Y(s) \cdot s^2 + 4 \cdot Y(s) = \frac{1}{5+2} \Rightarrow Y(s) \cdot (s^2 + 4) = \frac{1}{5+2} \Rightarrow Y(s) = \frac{1}{5+2} \cdot \frac{1}{5^2+4}$$

$$\Rightarrow Y(5) = \frac{A}{5+2} + \frac{B \cdot 5 + L}{5^2 + 4}$$

$$\Rightarrow \frac{1}{3+z} \cdot \frac{1}{5^2+4} = \frac{A}{5+2} + \frac{B \cdot 5 + C}{5^2+4} \Rightarrow 1 \cdot 1 = A \cdot (5^2+4) + (B \cdot 5 + C)(5+2)$$

$$\begin{cases}
A + B = 0 \Rightarrow A = -B \\
2B + C = G \Rightarrow -2B = C \Rightarrow 2A = C
\end{cases}$$

$$\Rightarrow C = \frac{1}{2} - C \Rightarrow 2C \\
\Rightarrow 2A = \frac{1}{4} \Rightarrow A = \frac{1}{8}$$

$$(4A + 2c = 1 \Rightarrow 2A + C = \frac{1}{2} \Rightarrow 2A = \frac{1}{2} - C \Rightarrow B = \frac{1}{8}$$

$$\Rightarrow C = \frac{1}{2} - C \Rightarrow 2C = \frac{1}{2} = \frac{1}{4}$$

$$\Rightarrow 2A = \frac{1}{4} \Rightarrow A = \frac{1}{8}$$

$$\Rightarrow B = \frac{1}{8}$$

$$Y(s) = \frac{\frac{1}{8}}{5+2} + \frac{\frac{1}{8} \cdot s + \frac{1}{4}}{5^2 + 4} = \frac{1}{8} \cdot \frac{1}{5+2} - \frac{1}{8} \cdot \frac{5}{5^2 + 4} + \frac{1}{8} \cdot \frac{2}{5^2 + 2^2}$$

$$y(t) = \frac{1}{8} \cdot e^{-26} + \frac{1}{8} \cdot COS(2t) + \frac{1}{8} \cdot Sin(2t)$$

$$y(t) = \frac{1}{8} \left( e^{-2t} + \cos(2t) + \sin(2t) \right)$$
